

STREETFEAST

Product Requirements Document (PRD)

Street Food Discovery & Recommendation App

Version 1.0 | June 2025

Product Name	StreetFeast
Problem Statement	Build a street food finder app that helps users discover the best street food in their city.
Target Segment	GenZ + Millennials (up to age 25), Tier-1 cities — approx. 200M addressable users
Sub-segment Focus	Food stalls and food trucks (literate vendors with smartphone access)
Assumption	GST and FSSAI licence validation completed during vendor onboarding
Document Status	Draft — PM Project v1.0

1. Executive Summary

StreetFeast is a mobile-first platform that bridges urban food lovers with street food vendors through hyperlocal discovery, short video-based recommendations, and crowd-sourced local recommendation scores. Unlike Zomato or Swiggy, which focus on delivery and do not distinguish authentic street food identity, StreetFeast is purpose-built for the street food ecosystem.

The Indian street food market is a \$41 Bn unorganised segment growing at 39% CAGR. StreetFeast targets 10% of the 200M GenZ + Millennial segment in Tier-1 cities within a 2–3 year horizon.

2. Market Context & Opportunity

2.1 Market Size

- INR 1,868 Bn market expected by 2025
- \$41 Bn unorganised street food market in India
- 39% CAGR expected by 2025
- 278M food truck growth signals vendor preference for modernised, mobile sales

2.2 Competitor Gaps

Competitor	Focus Area	Street Food Gap
Zomato / Swiggy	Delivery of restaurant food	Does not distinguish or highlight street food identity
Street Food Wala	Fast food delivery	Focuses on doorstep delivery, not discovery
Ex Plate Parcel	Street food origin	Pivoted to restaurants; abandoned street food focus

2.3 Sub-Segment Selection Rationale

Three vendor types exist: food streets with stalls, push cart vendors, and food trucks. Push carts were excluded because per NASVI, 70% of Indian street food vendors are literate — this literacy is found primarily among food stall and food truck sellers who engage with digital platforms and social media. Food trucks are growing rapidly, confirming the modernisation trend.

- Selected sub-segments: Food streets with stalls + Food trucks

- Push carts excluded: low digital literacy, high mobility makes location-tracking impractical

3. Problem Statement & Validation

3.1 Core Hypothesis

Street food is unorganised and tedious to locate. Vendors mobilise frequently, which forces users to either eat whatever is nearby (suboptimal choice) or travel far to find their preferred option. There is no platform that connects authentic street food vendors with the right customers through local trust signals.

3.2 User Research Findings

Primary Research — 7 Interviews, 40 Survey Responses

- ~70% of vendors said customers discover them via food vlogs
- ~40% of customers confirmed that vendor mobility makes precise location difficult
- ~80% of users prefer food served hot, and value seeing hygiene live at the stall

Survey Signals (Top Categories)

- Students / Mid Working professionals — highest street food consumption segment (~75% of responses)
- Max 5 km travel willingness — users won't go far to find street food
- Hygiene preference — strong concern, ~65% of respondents
- Can't find best taste — highest pain point, ~85% of respondents
- Local recommendations — critical trust driver, ~70% of respondents

Secondary Research Insights

- Students and mid-working professionals consume street food significantly more than other segments
- Tier-1 city residents represent the highest street food consumption demographic
- This segment is highly tech-savvy with easy digital reach

4. User Personas

4.1 Customer Persona — Shreya

Profile	Shreya, 23, Student, Delhi
Goal	Find the best street food nearby without trial and error
Pain Point	Vast options but still searching for the perfect, authentic bite
JTBD	Help me match authentic taste with local recommendations so I can enjoy the best meal without wasting time or money.

4.2 Vendor Persona — Vidyuth

Profile	Vidyuth, 29, Street Food Seller, Delhi
Goal	Acquire more customers easily and grow foot traffic
Pain Point	Low foot traffic despite affordable prices and authentic taste
JTBD	Help me find ways to attract more customers so I can grow my business without relying solely on walk-in traffic.

4.3 User Segmentation Matrix

Attribute	Upto 25 (Target)	25–40	40+
Job	Student / Mid Working	Working	Working / Retired
Location	Tier-1	Tier-1	Tier-1
Time Spent	High	Medium	Low
Order Rate	High	High	Low
Tech Savvy	High	High	Medium

5. Product Goals & Success Criteria

5.1 Product Goal

Build a product that helps users locate the best street food in their city by bridging foodies and street food artisans through a community-powered, video-first discovery platform.

5.2 Value Delivered

For Customers

- Locate food trucks and stalls accurately with real-time location details

- Match food to personal taste using local recommendation scores
- Discover new vendors through short video vlogs from trusted creators
- Save money with coupons unlocked by completing post-purchase surveys

For Vendors

- Increase customer foot traffic without relying on word-of-mouth alone
- Build a verified online identity through recommendation scores and video features
- Access a digital storefront (menu, location, operating hours) for the first time

For StreetFeast

- Build the first major community platform in the unorganised street food market
- Capture user data and preference signals to enable personalised recommendations
- Monetise through video placements, coupon transactions, and eventual delivery expansion

5.3 North Star Metric

$$\text{Retention Rate} = \text{Retained Users} / (\text{Retained Users} + \text{Churned Users})$$

Retention is the north star because the product is in its introduction stage (0–1 on the PLC). Demonstrating product-market fit before scaling is critical.

6. Solution & Feature Prioritisation

6.1 Solution Candidates

VBR — Video Based Recommendation (Priority 1)

A dedicated Vlogs tab with scrollable short food videos featuring vendor location, local recommendation score, and best-seller items. Videos sourced from top city food vloggers and locals — monetised for the platform.

VYB — Vote Your Bite (Priority 2)

A weekly vote system running Sat–Sun where users rate their favourite street food sellers. Results update live; sellers with the highest votes get visibility boosts.

CC — Create Community (Priority 3)

A mandatory post-purchase feedback mechanism and text-based community forum that creates social buzz around street food sellers.

DF — Deliver Food (Deprioritised)

On-demand delivery of street food to customers' homes. Eliminated in Level-1 prioritisation due to a critical feasibility risk: street food loses temperature and quality quickly, leading to increased customer complaints and reduced CSAT.

6.2 Prioritisation — RICE Framework

Solution	Reach	Impact	Confidence	Effort (P/M)	RICE Score
VBR – Video Based Recommendation	5	3	5	5	15 ★ (Priority 1)
VYB – Vote Your Bite	3	2	4	3	8 (Priority 2)
CC – Create Community	4	1	3	3	4 (Priority 3)
DF – Deliver Food	—	—	—	—	Eliminated (feasibility risk)

VBR scores highest (15) due to maximum reach, strong confidence from vlog-discovery research insight, and the inherently viral nature of short-form food video content. It becomes the MVP core feature.

7. Detailed Feature Requirements

7.1 Authentication

- OTP-based mobile number sign-in / sign-up
- Location permission requested immediately post-login (GPS access required for proximity features)
- Existing user check: route to landing page vs. account creation flow

7.2 Vlogs Tab (Core Feature)

- Scrollable short-form video feed — TikTok-style vertical scroll
 - Each video shows: distance from current location, local recommendation score, best-seller tag
 - Tap on any label below the video to navigate directly to the food truck menu page
- Videos sourced from: top city food vloggers (monetised) + local user submissions
- Recommendation score overlay — live average calculated from post-purchase surveys
- Share functionality on every video card

7.3 Bytz Tab (Discovery)

- Three discovery modes:
 - Top Picks — personalised recommendations based on past orders and preferences
 - Local Recommends — vendors with the highest local recommendation scores nearby
 - Near You — all vendors within a 5 km radius of the user
- Each vendor card shows: distance, open/closed status, local recommendation score

7.4 Food Truck Menu / PDP

- Vendor details: operating hours, distance from user, open/closed status
- Local Recommendation Score prominently displayed
- Menu with item photos, prices, and add-to-cart functionality
- Frequent Buys section — derived from third question of the post-purchase survey
- Try These section — platform-curated suggestions

7.5 Cart & Payment

- Cart management: add/remove items, update quantities
- Coupon code field — coupons issued only to users who previously completed the post-purchase survey
- Automatic coupon application if eligible
- Payment options: PhonePe, GPay, other UPIs, or Cash
- GST applied at checkout; platform fee included in order total

7.6 Post-Purchase Survey (Recommendation Engine Input)

- Triggered immediately after payment completion
- Three questions:
 - Q1: Was hygiene maintained during preparation? (Yes/No) — contributes to score out of 100
 - Q2: How well does it taste? (0–30 / 30–60 / 60–100) — contributes to score out of 100
 - Q3: Your top pick for today? (item selection) — identifies best-seller for Frequent Buys
- Score formula: $\text{Sum of Q1 + Q2 ratings} / \text{Total number of users who transacted}$
- Completing the survey unlocks a discount coupon for the next order

7.7 Profile & Support

- User profile with account details
- Order history and past survey responses
- Customer support — accessible from Day 1; direct contact with defined ETA for resolution
- Logout functionality

8. System Design Overview

8.1 Architecture

- Load balancer routes requests to Application Server 1 or 2 based on load
- Cache servers sit between app servers and database for read-heavy operations (video feeds, recommendation scores)
- Database tables: Profile Creation, Vlog Data, Food Truck, RecommendScore & BestSeller

8.2 Key API Operations

Operation	Method	Description
User account creation	POST	Create user profile on sign-up
View video feed	GET	Fetch Vlogs tab content with location filter
Place food order	POST	Submit cart and initiate payment
Submit payment	POST	Process UPI or log cash transaction
Submit survey	POST	Push survey response; update recommendation score average

8.3 User Journey Flow

- Sign In / Sign Up via OTP
- Location permission granted
- Landing page: Vlogs tab default
- User scrolls videos; checks location, rec score, best seller for each vendor
- Taps a vendor → checks menu page → selects food → adds to cart
- Applies coupon (if survey previously completed) → pays via UPI or cash
- Post-payment: survey triggered → scores updated → coupon issued for next order
- Scores and best-sellers updated in database; feed refreshed for all users

9. Risks & Mitigations

Risk		Mitigation
Fake recommendation scores: vendors incentivise users to inflate scores and best-sellers artificially	→	Set a minimum average order value threshold (>₹200) before a survey response is counted — ensures only genuine purchasers contribute to scores
Payment processing failures: UPI/cash issues frustrate users and cause abandoned transactions	→	Integrate Razorpay as the primary payment gateway with built-in troubleshooting; provide in-app payment support with defined SLA
Variable video quality: local user videos may be low quality compared to professional vlogger content	→	Establish clear content guidelines for all creators; allow users to rate/flag videos; deprioritise underperforming creators algorithmically
Low perceived value: users may not engage with recommendation scores or find the feature compelling	→	Conduct ongoing qualitative research post-launch to identify 'why' behind low engagement; iterate rapidly on score display and survey completion incentives

10. Go-To-Market Strategy

10.1 Target Market & Positioning

- Target Market: Literate street food sellers with at least basic smartphone knowledge
- Target Customer Segment: GenZ + Millennials in Tier-1 cities
- Market Positioning: The best street food locator app — curated video vlogs with a local recommendation score

10.2 Business Model — Transaction-Based (2–3 Year Plan)

0–6 Months: Acquisition & Score Building

- Revenue formula: Users × Transactions
- Discount offered to users who complete the post-purchase survey → drives recommendation score and bestseller data
- Goal: acquire initial user base and populate recommendation engine

6–12 Months: Retention via Wallet & Streak

- Introduce in-app wallet
- Users must complete at least 3 transactions per month (streak) to earn a wallet discount
- Goal: build habitual usage and increase monthly active transactions

12–36 Months: Monetisation Expansion

- Discounts apply only when Average Order Value (AOV) > ₹250
- Add food delivery service based on demand signals and logistics feasibility
- Expand from Tier-1 to Tier-2 and Tier-3 cities based on feedback loops

10.3 Marketing Channels (Initial 6 Months)

- Food Vloggers Meet: Partner with top local food vloggers to highlight the recommendation score USP on their platforms
- Vendor Training: Onboard vendors with training on how to mention app discounts to customers at point of sale
- Customer Support: Live from Day 1 — fast, accurate resolutions to build trust early
- Feedback Loops: Rapid iteration based on user and vendor feedback post-launch

11. Metrics & Analytics Framework

11.1 Product Life Cycle Focus

Stage	What to Focus On	Key Metric
0–1 (Intro)	Is the product market fit?	Retention
1–10 (Growth)	Scaling the user base	Revenue
10–100 (Scale)	Reducing acquisition cost	Customer Acquisition Cost (CAC)

11.2 Full Metrics Framework

Metric Category	Measurement Definition
Exposure	CTR via ads; CTR via vlogs and vendor mentions
Adoption	Number of app downloads
Activation	# users who completed first transaction = Paid users / Total users
Engagement	# users viewing and sharing videos / # total acquired users; Session duration (time spent per visit)
Retention	% users who return to the app via rec score and vlogs; D3, D7, D15, D30 retention cohorts
Drop-Off Rate	% of users dropping from a specific page (funnel drop analysis)
Revenue	Profit = Total Revenue – Ad Spend Cost – Monetisation Cost
Referral	NPS score and CSAT promote referral — tracked via periodic surveys
NFRs	App load time; server scalability (horizontal and vertical); app crash rates; payment load time

11.3 Success Threshold

A product is considered successful when:

- Customer Acquisition Cost (CAC) is minimised
- Lifetime Value (LTV) significantly exceeds CAC
- Retention rate shows improving D30 cohorts across successive launch months

12. Open Questions & Future Scope

12.1 Open Questions

- How will vendor onboarding be scaled in Tier-1 cities before launch? Manual team vs. self-serve portal?
- What is the minimum number of active vendor listings required before a city is launched to ensure a good first-time user experience?
- What content moderation policies govern video submissions from local users?
- How will the recommendation score be prevented from gaming as the platform scales beyond a minimum order value threshold?
- What is the technical approach for real-time vendor location tracking for food trucks that move daily?

12.2 Future Scope (Post 1Y)

- Food delivery expansion — feasibility validation based on AOV trends and logistics partner assessment
- Tier-2 and Tier-3 city rollout — using feedback loops and organic vlogger-driven demand signals
- Vendor analytics dashboard — help vendors understand their recommendation score trends, peak customer hours, and best-seller performance
- Personalised taste profile — use order history and survey data to build a user taste graph for improved recommendations
- StreetFeast Creator Programme — formalise the food vlogger ecosystem with incentive structures and content SLAs
